probabilistic databases are databases where the value of some attributes or the presence of some records are uncertain and known only with some probability applications in many areas such as information extraction rfid and scientific data management data cleaning data integration and financial risk assessment produce large volumes of uncertain data which are best modeled and processed by a probabilistic database this book presents the state of the art in representation formalisms and query processing techniques for probabilistic data it starts by discussing the basic principles for representing large probabilistic databases by decomposing them into tuple independent tables block independent disjoint tables or u databases then it discusses two classes of techniques for query evaluation on probabilistic databases in extensional query evaluation the entire probabilistic inference can be pushed into the database engine and therefore processed as effectively as the evaluation of standard sql queries the relational queries that can be evaluated this way are called safe queries in intensional query evaluation the probabilistic inference is performed over a propositional formula called lineage expression every relational query can be evaluated this way but the data complexity dramatically depends on the query being evaluated and can be p hard the book also discusses some advanced topics in probabilistic data management such as top k query processing sequential probabilistic databases indexing and materialized views and monte carlo databases table of contents overview data and query model the query evaluation problem extensional query evaluation intensional query evaluation advanced techniques

despite the long association of organohalogen compounds with human activities nature is the producer of nearly 5 000 halogen containing chemicals once dismissed as accidents of nature or isolation artifacts organohalogen compounds represent an important and ever growing class of natural products in many cases exhibiting exceptional biological activity since the last comprehensive review in 1996 vol 68 this series there have been discovered an additional 2 500 organochlorine organobromine and other organohalogen compounds these natural organohalogens are biosynthesized by bacteria fungi lichen plants

marine organisms of all types insects and higher animals including humans these compounds are also formed abiogenically as in volcanoes forest fires and other geothermal events in some instances natural organohalogens are precisely the same chemicals that man synthesizes for industrial use and some of the quantities of these natural chemicals far exceed the quantities emitted by man
